

UNIVERSITY OF SWAZILAND

MAIN EXAMINATION PAPER 2013

TITLE OF PAPER : NON-PARAMETRIC ANALYSIS

COURSE CODE : ST409

TIME ALLOWED : 2 (TWO) HOURS

**REQUIREMENTS : STATISTICAL TABLES
AND CALCULATOR**

**INSTRUCTIONS : ANSWER QUESTION ONE AND ANY
THREE (3) QUESTIONS. ALL QUESTIONS
CARRY MARKS AS INDICATED WITHIN
THE PARENTHESIS.**

**THIS PAPER IS NOT TO BE OPENED UNTIL PERMISSION HAS
BEEN GRANTED BY THE INVIGILATOR**

ANSWER QUESTION ONE & ANY THREE QUESTIONS:

For all questions, clearly state the name of the test, the null & alternate hypotheses, the test statistics, the decision rule, the level of significance, the decision & the conclusions.

QUESTION ONE.

[20 + 20 marks]

The EPA wants to determine whether temperature changes in the ocean's water caused by a nuclear power plant will have a significant effect on the animal life in the region. Recently hatched specimens of a certain species of fish are randomly divided into four groups. The groups are placed in separate simulated ocean environments that are identical in every way except for water temperature. Six months later, the specimens are weighed. The results (in ounces) are given in the following table.

<i>Weights of Specimens</i>			
38°F	42°F	46°F	50°F
22	15	14	17
24	21	28	18
16	26	21	13
18	16	19	20
19	25	24	21
17	23		

- a. Do the data provide sufficient evidence to indicate that one (or more) of the temperatures tend(s) to produce larger weight increases than the other temperatures? Use $\alpha = 0.05$. Also calculate the P-value.
- b. Test again, using Mann-Whitney test to see whether the data indicate that the temperature of 46°F tends to produce larger weight increases than 38°F .

QUESTION TWO.

[10 + 10 marks]

- a. An economist has been computing a monthly "prosperity index." For the last 24 months the values obtained are:

123.6 121.0 124.1 123.4 125.7 129.0 126.8 127.1 127.3 126.7 124.8 125.9
 124.7 125.9 125.6 126.0 125.7 123.3 127.7 129.0 128.2 127.9 127.8 127.1

Do these figures indicate a trend in the prosperity index? Use 5% level of significance and calculate the P-value.

- b. The "maximum annual river stages" reported at a certain point each year for 16 years were (in feet):

7.4 7.8 6.9 8.1 7.1 7.4 6.8 6.9 7.6 7.6 8.0 8.3 7.5 7.8 7.1

Test that the median maximum annual river stage is no greater than 8.0 feet. Use 10% level of significance and calculate the P-value.

QUESTION THREE.

[20 marks]

Cancer cells are injected into 15 laboratory mice to study the effectiveness of a proposed treatment. Six mice were given the cancer prevention treatment and the other nine were given a placebo (the control group). After several months the size of the tumors were measured in each animal.

	Size of Tumors					
Treatment	0.8	0.0	0.6	1.1	1.2	0.5
Control	0.6	1.6	1.7	1.3	2.2	1.5

Is the treatment effective in reducing the eventual size of the tumor? Use Smirnov test. Also find the P-value.

QUESTION FOUR.

[20 marks]

Dental researchers have developed a new material for preventing cavities, a plastic sealant, which is applied to the chewing surfaces of teeth. To determine whether the sealant is effective, it was applied in half of the teeth of each of twelve school-age children. After 5 years, the number of cavities in the sealant-coated teeth and untreated teeth were counted. The results are given in the following table:

Child	Sealant-coated	Untreated
1	3	3
2	1	3
3	0	2
4	4	5
5	1	0
6	0	1
7	1	5
8	2	0
9	1	6
10	0	0
11	0	3
12	4	3

Is there sufficient evidence to indicate that sealant-coated teeth are less prone to cavities than are untreated teeth? Use $\alpha = 0.05$. Also calculate the P-value.

QUESTION FIVE.

[20 marks]

A new worker is assigned to a machine that manufactures bolts. Each day a sample of bolts is examined and the percent defective is recorded. Do the following data indicate a significant improvement over time for that worker?

Day	Percent	Day	Percent
1	6.1	8	4.5
2	7.5	9	4.9
3	7.7	10	4.6
4	5.9	11	3.0
5	5.2	12	4.0
6	6.1	13	3.7
7	5.3		

Use either Spearman's ρ test or Kendall's τ test with $\alpha = 0.10$.

'The entries in this table are quantiles z_p of the standard normal random variable Z selected so $P(Z \leq z_p) = p$ and $P(Z > z_p) = 1 - p$. Note that the value of p to two decimal places determines which row to use; the third decimal place of p determines which column to use to find z_p .

TABLE A2 Chi-Squared Distribution*

For $k > 100$ use the approximation $w_k = (ii)(z_k + \sqrt{2k-1})^2$, or the more accurate $w_k =$

$k \left(1 - \frac{2}{9k} + z_0 \sqrt{\frac{2}{9k}} \right)$, where z_0 is the value from the standardized normal distribution shown in the bottom of the table.

SOURCE: Abridged from Table B, Vol. I of Pearson and Hartley (1976), with permission from the Biometrika Trustees.

* The entries in this table are quantiles w_p of a chi-squared random variable W such that $P(W \leq w_p) = p$ and $P(W > w_p) = 1 - p$.

*Y has the binomial distribution with parameters *n* and *p*. The entries are the values of $P(Y \leq y) = \sum_{i=0}^y \binom{n}{i} p^i (1-p)^{n-i}$, for *p* ranging from 0.05 to 0.95.

For *n* larger than 20, the *r*th quantile *y_r* of a binomial random variable may be approximated using $y_r = np + z_r \sqrt{np(1-p)}$, where *z_r* is the *r*th quantile of a standard normal random variable, obtained from Table A1.

For *n* or *m* greater than 20, the *p*th quantile *w_p* of the Mann-Whitney test statistic may be approximated by

$$w_p = n(N + 1)/2 + z_{p/2} \sqrt{nm(N + 1)/12}$$

where *z_p* is the *p*th quantile of a standard normal random variable, obtained from Table A1, and where *N* = *m* + *n*.*The entries in this table are quantiles *w_p* of the Mann-Whitney test statistic *T*, given by Equation 5.1.1, for selected values of *p*. Note that *P(T < w_p)* ≤ *p*. Upper quantiles may be found from the equation

$$w_p = n(n + m + 1) - w_{1-p}$$

Critical regions correspond to values of *T* less than (or greater than) but not equal to the appropriate quantile.TABLE A8 Quantiles of the Kruskal-Wallis *T* Statistic for Small Sample Sizes*

For n greater than 30 the approximate quantiles of ρ may be obtained from

$$w_p \approx \frac{z_p}{\sqrt{n-1}}$$

where z_p is the p th quantile of a standard normal random variable obtained from Table A1.

SOURCE: Adapted from Glasser and Winter (1961), with corrections, with permission from the Biometrika Trustees.

*The entries in this table are selected quantiles w_p of the Spearman rank correlation coefficient ρ when used as a test statistic. The lower quantiles may be obtained from the equation

$$w_p = -w_{1-p}$$

The critical region corresponds to values of ρ smaller than (or greater than) but not including the appropriate quantile. Note that the median of ρ is 0.

TABLE A11 Quantiles of the Kendall test statistic $T = N_c - N_s$. Quantiles of Kendall's τ are given in parentheses. Lower quantiles are the negative of the upper quantiles, $w_p = -w_{1-p}$.

For n greater than 60, approximate quantiles of T may be obtained from

$$w_p \approx z_p \sqrt{\frac{n(n-1)(2n+5)}{18}}$$

where z_p is from the standard normal distribution given by Table A1. Approximate quantiles of τ may be obtained from

$$w_p \approx z_p \sqrt{\frac{V(2n+5)}{3\sqrt{n(n-1)}}$$

Critical regions correspond to values of T greater than (or less than) but not including the appropriate quantile. Note that the median of T is 0. Quantiles for τ are obtained by dividing the quantiles of T by $(n-1)/2$.

For n larger than 50, the p th quantile w_p of the Wilcoxon signed ranks test statistic may be approximated by $w_p = [n(n + 1)/4] + z_p \sqrt{n(n + 1)}(2n + 1)/24$, where z_p is the p th quantile of a standard normal random variable, obtained from Table A1.

SOURCE: Adapted from Harter and Owen (1970), with permission from the American Mathematical Society.

*The entries in this table are quantiles w_p of the Wilcoxon signed ranks test statistic T^+ , given by Equation 5.7.3, for selected values of $p \leq 0.50$. Quantiles w_p for $p > 0.50$ may be computed from the equation

$$w_p = n(n + 1)/2 - w_{1-p}$$

where $n(n + 1)/2$ is given in the right hand column in the table. Note that $P(T^+ < w_p) \leq p$ and $P(T^+ > w_{1-p}) \leq 1 - p$ if H_0 is true. Critical regions correspond to values of T^+ less than (or greater than) but not including the appropriate quantile.

*The entries in this table are selected quantiles w_p of the Kolmogorov test statistics T , T^+ , and T^- as defined by Equation 6.1.1 for two-sided tests and by Equations 6.1.2 and 6.1.3 for one-sided tests. Reject H_0 at the level α if T exceeds the $1 - \alpha$ quantile given in this table. These quantiles are exact for $n \leq 40$ in the two-tailed test. The other quantiles are approximations that are equal to the exact quantiles in most cases. A better approximation for $n > 40$ results if $(n + \sqrt{n}/10)^{1/2}$ is used instead of \sqrt{n} in the denominator.

^aThe entries in this table are selected quantiles w_n of the Smirnov two-sample test statistic T defined by Equations 6.3.2 and 6.3.3 for the one-tailed test and defined by Equation 6.3.1 for the two-tailed test. Reject H_0 at the level α if T exceeds the $1 - \alpha$ quantile of T as given in this table. The test statistic is a discrete random variable, so the exact level of significance may be less than the apparent α used in this table.

 Entries in this table are selected quantiles *w_p* of the Smirnov test statistic *T* for two samples, defined in sections 6.3.1, 6.3.2, and 6.3.3. To enter the table let *N*₁ be the smaller sample size and let *N*₂ be the larger sample size. Reject *H*₀ at the level *α* if *T* exceeds *w_{1-α}* as given in this table. If *n* and *m* are not covered by this table, use the large sample approximation given at the end of the table, or consult exact tables by Jennrich, which appear in Harter and Owen (1970) for *n*, *m* ≤ 100.

^aThe entries in this table are quantiles *w_p* of the *t* distribution for various degrees of freedom. Quantiles *w_p* for *p* < 0.5 may be computed from the equation

$$w_p = -w_{1-p}$$

Note that *w_{0.50}* = 0 for all degrees of freedom.
